

Release Note

Release Date: Feb 16, 2023

Version Number: 1.0.0

Details for Major Changes Included

- **User interfaces for the Note application**

In this release, the user interface for the Note application is set up. Now, the application has

- A top-level menu bar with major functionalities of the notes app. Each functionality has its own hotkey
- A text editor with a toolbar that allows user to input rich text for the content of the note

The application now also supports window resizing, minimizing and maximizing the window, and saving the window position and size locally so that the window will appear at the same location as where the user lastly closes the window.

- **Add, delete and edit notes functionalities**

In this release, the Note application supports adding, deleting, and editing ungrouped notes. For each functionality:

- Add note: add an empty note titled “New Note”, and display an alert if users try to create a second new note while they haven’t put anything into the first new note.

- Delete note: display a list of all the notes (including those inside groups) and users can select one or more notes to delete.
- Edit a note: users can click on a note to show its content, edit the content, and save the note by clicking the save button. The title is set to the first line of the note.
- Add and delete group functionalities

In this release, the Note application supports adding and deleting notes. For each functionality:

- Add group: add a group requiring the user to provide a name which cannot be a duplicate of an existing group or an empty string
 - Delete group: displays a list of all existing groups and the user can select one or more groups to delete
- Installer
 - The installer for this release of the Note application is created and is put inside the “releases” folder on GitLab
 - Console app for the Note application

In this release, the launch script

- is created to accomplish limited functionalities desired
- script accounts for potential args and features to be added later

List of Known Issues / Limits

1. Currently, when the user adds a new note, it will always be added to the “Note” section. In other words, the user is unable to add a note to a group directly. In later sprints, we will add the functionality to support adding a note to a group directly.

2. Currently, the installer is the most basic installer generated by Gradle. In later sprints, we will create a formal installer for the Note application.
